

SiteCom® integrates real-time data, historical data, reports, and files from all sources on the rig and makes them available to the relevant community through a single web-based interface. A globally distributed team then has simultaneous and reliable access to the same information during all operations on the rig.

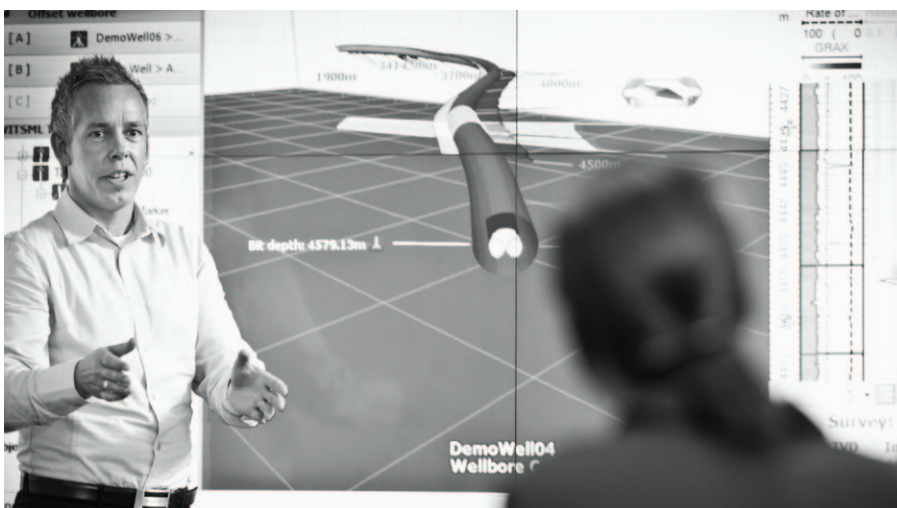

SiteCom

With the integration of rigs, platforms, support offices, and third-party suppliers into a single collaborative community, SiteCom provides enhancements in safety, efficiency and ultimately profitability through better informed

decisions being made more quickly. SiteCom was the first product on the market based on the WITSML standard – the oilfield standard for drilling data transfer. No one can beat SiteCom for speed, security, and flexibility to accommodate the growing number and variety of real-time data sources.

An Integrated Global Environment

SiteCom enables a sophisticated, fully-distributed, integrated environment to be established, to support drilling and well construction decisions. From this comes a wealth of benefits that improves the safety and efficiency of operations, environmental impact, and ultimately, the bottom line. All within one single viewing tool, Discovery Web™.

Assured Data Security

SiteCom can be configured so that data is never available outside of the corporate firewall, thereby giving full control of assets at all times.

Faster Decisions

In side-to-side trials with leading competitors, SiteCom delivered real-time drilling data to distributed users faster and more robustly than any other system and Discovery Web updates images in the browser faster than any other drilling visualization tool available on the market.

Turning data into Information

SmartAgents are layered on top of the SiteCom installation to perform calculations required for better interpretation of events - automatically and in real time. SmartAgents can identify invisible lost time, help to determine fluid and rock parameters, and assist with decisions relating to hydraulics, drilling parameters, and other events.

Improved Data Quality

SiteCom features technology for automatically verifying the accuracy and quality of data before distribution, ensuring that decisions are based on a true picture of what is happening in the well and on the rig.

Components

SiteCom

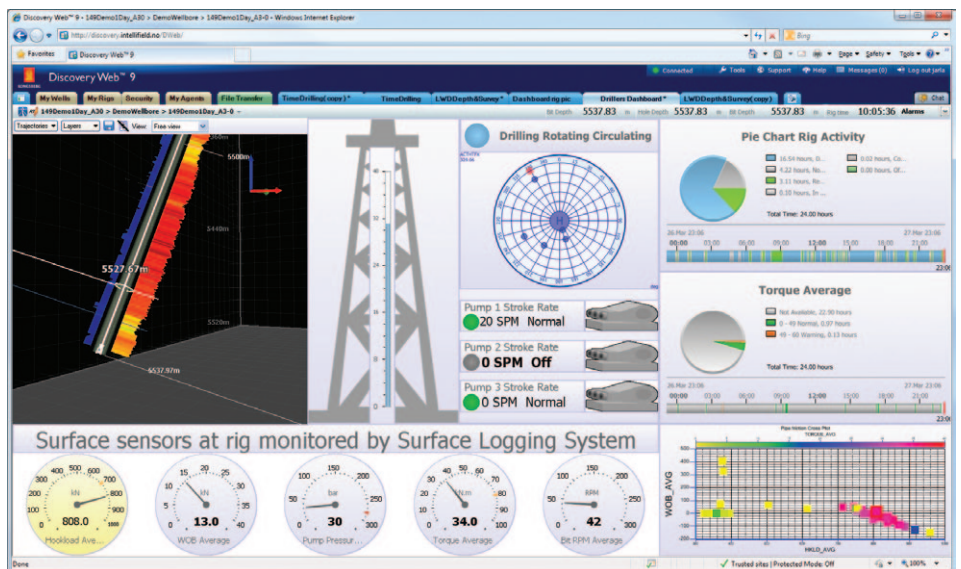

Automatically aggregates, distributes and manages real-time data, files, reports, and other drilling communications.

Discovery Web

Discovery Web is the most advanced visualization tool on the market for improved drilling decision-making.

SiteCom Toolbox

Easy-to-connect modules designed to perform real-time calculations to ensure that drilling efficiency is maximized.
